

6.2

Draw the **special angle triangles** IN RADIANS.

How do you find **all the special angles** in the interval $[0, 2\pi]$?

Label the diagram:

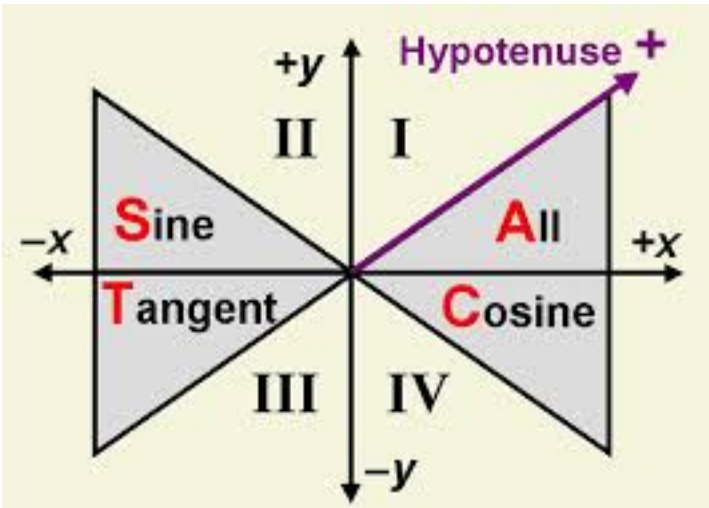

Initial arm

Terminal arm

Angle in standard position

Determine an **equation for r** .

What is the CAST rule?

Find the angle in radians of the angle whose terminal arm ends at $(4,3)$.

Find the angle in radians of the angle whose terminal arm ends at $(3,-7)$

Find the angle in radians of the angle whose terminal arm ends at $(-4,-9)$

Determine $\sin (3\pi /2)$ two ways.

Determine the exact value of $\cot (\pi / 2)$

Determine the exact value of $\sin 4\pi/3$.

Related Acute Angle

$$\text{In Q2 } \theta_r = \pi - \theta$$

$$\text{In Q3 } \theta_r = \theta - \pi$$

$$\text{In Q4 } \theta_r = 2\pi - \theta$$

Determine the exact value of $\cos(5\pi/4)$ and $\csc(11\pi/6)$

If $\cos \theta = -6/7$, where $\theta \in [0, 2\pi]$, evaluate θ to the nearest hundredth.

Solve for θ if $\tan \theta = -7/24$
